

Release Note

Winpos Mega - Version 1044 Release

Option to restrict Article use in POS (#484)

May 2023

Introduction

It is now possible to restrict some article functionality per terminal by defining (using settings) which Article codes are 'valid' for a specific Terminal.

Changes

New setting: Parameters.Settings.REG.ArticleLimitMinMax = True/False

Default is False

When False, behaviour is as existing.

Existing settings are also used to define the Articles which are valid for a specific Terminal **if ArticleLimitMinMax = True.**

The existing settings are:

Settings.Limits.Article maximum

Settings.Limits.Article minimum

If **ArticleLimitMinMax = True** AND **an Article PLU code is outside the range defined by Article minimum -> Article maximum (inclusive)**, then it will be deemed to be **'Restricted'** in use at the Terminal for which the settings are defined.

Processing of Restricted Articles in the POS (REG)

'Restricted' Articles are affected as follows in REG:

1. They are not visible in Article search functions.
2. They are prevented from being added into the Sales basket by scanning or keying in the barcode or Article PLU code.
3. They are prevented from being used in other Article-specific functions in the REG (e.g. Price Enquiry)

Additional Specific Case:

The following case specific is handled by this development as described below:

- **Case:**

- If more than one Article has the same EAN number (Article Code2)
AND
- only one (1) of these Article is NOT restricted, then that un-restricted Article will be added to the sales basket automatically, without the Search window being displayed.

- **Example:**

If Article 11111 has Article Code 2 = 123

and

Article 2222 has Article Code 2 = 123

If Terminal 987 is assigned Limits: Article Min 1000, Article Max = 1999 AND
ArticleLimitMinMax=True.

Then, in REG:

If Article Code 2 = 123 is scanned in REG on Terminal 967, then REG loads Article 11111 automatically into the Sales Basket.
